<b>Introduction</b>	<b>3</b>
<b>Medical problems related to alcohol</b>	<b>5</b>
<b>Alcohol as a cause of death</b>	<b>6</b>
<b>Scotland</b>	<b>13</b>
<b>Health benefits of alcohol</b>	<b>17</b>

In developed countries alcohol is one of the ten leading causes of disease and injury. Worldwide, alcohol causes 3.27 per cent of deaths (1.8 million) and 4 per cent of 'disability adjusted life years' lost (DALYS) (58.3 million). In developed countries, alcohol is responsible for 9.2 per cent of the disease burden.

### **Alcohol causes nearly 10 percent of all ill-health and premature deaths in Europe**

The World Health Organization's Global Burden of Disease Study finds that alcohol is the third most important risk factor, after smoking and raised blood pressure, for European ill-health and premature death.<sup>1</sup> Alcohol is more important than high cholesterol levels and overweight, three times more important than diabetes and five times more important than asthma.

This level of alcohol-related death, disease and disability is much higher in men than women and is highest in Europe and the Americas, where it ranges from 8%-18% for males and 2%-4% for females.

Beside the direct effects of intoxication and addiction, worldwide alcohol is estimated to cause 20-30% of cancer of the oesophagus, liver cancer, cirrhosis of the liver, epilepsy, homicide and motor vehicle accidents.

### **The more a country drinks, the greater the harm from alcohol**

The European Comparative Alcohol Study, financed by the European Commission, finds that as a country's alcohol consumption goes up and down, the harm done by alcohol goes up and down in parallel.<sup>2</sup> This applies to all European countries. Further, the higher the alcohol consumption of a country, the greater the harm from alcohol<sup>3</sup>. In Britain, deaths from liver cirrhosis (largely caused by alcohol) increased steeply between 1987 and 2001. Cirrhosis deaths in Scotland more than doubled, and are now among the highest in Western Europe. In England and Wales, cirrhosis deaths rose by two thirds. Deaths in women increased by almost half during this period. These increases were the steepest in Western Europe, and reflect the fact that alcohol consumption was rising significantly in Britain during this period while it was falling in the mainly wine drinking countries of southern Europe.<sup>4</sup>

### **The more an individual drinks, the greater the risk of harm**

For all types of alcohol-related harm, including cancers, cardiovascular diseases and cirrhosis of the liver, the more an individual drinks, the greater the risk of harm<sup>5</sup>. The annual risk of death from alcohol related cancers (mouth, gullet, throat and liver) increases from 14 per 100,000 for non-drinking middle-aged men to 50 per 100,000 at 4 or more drinks (4 glasses of wine) a day. The risk of breast cancer by age 80 years increases from 88 per 1000 non-drinking women to 133 per 1000 at 6 drinks (a bottle of wine) a day.

Risk of drinking compared with non-drinking appears to begin increasing significantly at an intake of around 3 drinks per day for:

- Cancers of the oral cavity and pharynx; oesophagus; larynx; breast; liver; colon; and rectum
- Liver cirrhosis
- Essential hypertension
- Chronic pancreatitis

- Injuries and violence

**Risks begin to rise with any drinking and increase further with increased intake.<sup>6</sup>**

Although a small amount of alcohol may reduce the risk of a heart attack, for many drinkers alcohol actually increases the risk of heart disease

One drink every second day gives almost all the protection that alcohol has on reducing the risk of a heart attack<sup>7</sup>. Above two drinks a day the risk of death from heart disease goes up, with the more alcohol drunk, the greater the risk.

**Whether consumed as wine, beer and spirits, it is alcohol that matters**

A glass of wine, 250ml of ordinary strength beer and a single measure of spirits are all equal in their impact on health.<sup>5</sup> The biochemical changes that might reduce the risk of heart disease result equally from beer, wine or spirits; they do not result from grape juice or wine from which the alcohol has been removed.<sup>8</sup>

In the UK, deaths from alcohol are increasing. For example, there were over 4000 deaths from liver cirrhosis (the main cause of which in the UK is alcohol) in 1999. Two thirds of the deaths occurred in under 65s. Over the last 30 years, deaths from this cause have increased 7-fold in men, 8-fold in women. Cirrhosis now kills more men than Parkinson's Disease, more women than cancer of the cervix.<sup>9</sup>

**Patterns of Drinking are Important**

In relation to both ill-health caused by alcohol and to its health benefits, the pattern of drinking may be as important as the total amount consumed.<sup>10</sup> Binge drinking is a particularly dangerous form of consumption. For example, risks for alcohol dependence jump dramatically for men who exceed 7/8 drinks per occasion, for women 5/6 drinks per occasion.<sup>11</sup> Similarly, it is the drinking pattern rather than the average number of drinks per week that is likely to be the most significant factor affecting adverse outcomes in pregnancy, with a binge drinking pattern being the most dangerous.<sup>10</sup> Also in regard to health benefits, the protective effect of alcohol in relation to cardiovascular disease is more a function of the frequency of drinking than amount consumed: small amounts consumed several times a week are more beneficial than the same amount consumed over fewer occasions.<sup>12</sup>

## Medical Problems Related to Alcohol<sup>13</sup>

### Nervous System

Acute intoxication	blackouts
Persistent brain damage:	Wernicke's encephalopathy Korsakoff's syndrome cerebellar degeneration dementia
Cerebrovascular disease:	strokes, especially in young people subarachnoid haemorrhage subdural haematoma after head injury
Withdrawal symptoms:	tremor, hallucinations, fits
Nerve and muscle damage:	weakness, paralysis, burning sensation in hands and feet

### Liver

Infiltration of liver with fat  
Alcoholic hepatitis  
Cirrhosis and eventual liver failure  
Liver cancer

### Gastrointestinal System

Reflux of acid into the oesophagus  
Tearing and occasionally rupture of the oesophagus  
Cancer of the oesophagus  
Gastritis  
Aggravation and impaired healing of peptic ulcers  
Diarrhoea and impaired absorption of food  
Chronic inflammation of the pancreas leading in some to diabetes and malabsorption of food.

### Nutrition

Malnutrition from reduced intake of food, toxic effects of alcohol on intestine, and impaired metabolism, leading to weight loss  
Obesity, particularly in early stages of heavy drinking.

### Heart and Circulatory System

Abnormal rhythms  
High blood pressure  
Chronic heart muscle damage leading to heart failure

### Respiratory System

Fractured rib  
Pneumonia from inhalation of vomit  
Overproduction of cortisol leading to obesity, acne, increased facial hair, and high blood pressure  
Condition mimicking over-activity of the thyroid with loss of weight, anxiety, palpitations, sweating, and tremor  
Severe fall in blood sugar, sometimes leading to coma  
Intense facial flushing in many diabetics taking the anti-diabetic drug chlorpropamide.

## Reproductive System

In men, loss of libido, reduced potency, shrinkage in size of testes and penis, reduced or absent sperm formation and so infertility, and loss of sexual hair

In women, sexual difficulties, menstrual irregularities, and shrinkage of breasts and external genitalia

## Occupation and Accidents

Impaired work performance and decision making  
Increased risk and severity of accidents

## The Foetus, the Child and the Family

Damage to the fetus and the fetal alcohol syndrome  
Acute intoxication in young children produces hypothermia, low blood sugar levels, depressed respiration.  
Effect on physical development and behaviour of child through heavy drinking by parents  
Interaction of alcohol with medicinal substances  
Increased likelihood of unwanted effects of drugs  
Reduced effectiveness of medicines.

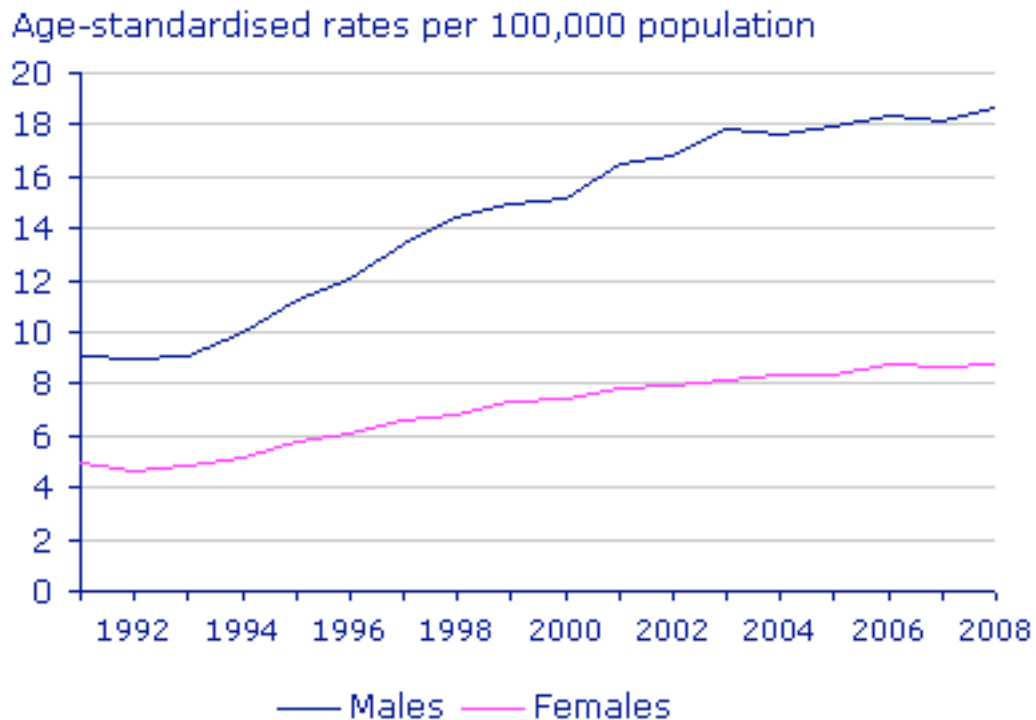

## Alcohol as a Cause of Death

### Estimates of proportion of deaths attributable to alcohol from various conditions<sup>14</sup>

Condition	% Attributable to alcohol
Cancer of oesophagus	14 – 75%
Cancer of liver	15 – 29%
Cancer of female breast	3 – 4%
Hypertension	5 – 11%
Chronic pancreatitis	60 – 84%
Acute pancreatitis	24 – 42%
Falls	23 – 35%
Drownings	30 – 38%
Fire injuries	38 – 45%
Suicide	27 – 41%
Assault	27 – 47%

The total number of deaths attributable to alcohol is uncertain. Estimates for the UK range from 8,000 to 40,000 per annum. The lower estimate refers to deaths from alcohol defined causes, mainly alcoholic liver disease. The higher estimate also allows for causes of death to which it is known that alcohol may contribute but which are not defined as alcohol-related. The graph below shows deaths for alcohol-defined conditions.

## Alcohol-related death rates, by sex, UK, 1991-2008<sup>15</sup>

The number of alcohol-related deaths in the United Kingdom has consistently increased since the early 1990s, rising from the lowest figure of 4,023 (6.7 per 100,000) in 1992 to the highest of 9,031 (13.6 per 100,000) in 2008. Although figures in recent years suggested that the trend was leveling out, alcohol-related deaths in males increased further in 2008. Female rates have remained stable.

There are more alcohol-related deaths in men than in women. The rate of male deaths has more than doubled over the period from 9.1 per 100,000 in 1991 to 18.7 per 100,000 in 2008. There have been steadier increases in female rates, rising from 5.0 per 100,000 in 1991 to 8.7 in 2008, less than half the rate for males. In 2008, males accounted for approximately two-thirds of the total number of alcohol-related deaths. There were 5,999 deaths in men and 3,032 in women.<sup>15</sup>

**Male alcohol-related death rates by age group, United Kingdom, 1991-2008<sup>15</sup>**

Age-standardised rates per 100,000 population

The trends differ according to age. For both males and females, the lowest rates across the period were in those aged 15-34. In 2008, the rates were 2.9 per 100,000 and 1.3 per 100,000 respectively. The highest rates have occurred in persons aged 55-74. In men, the rate has increased from 23.0 per 100,000 in 1992 and 1993 to 45.8 per 100,000 in 2008, the highest rate recorded across all age groups. Alcohol-related deaths in all age groups increased in 2008 compared with figures in 2007.

Alcohol-related death rates among females have been consistently lower than rates for males and trends demonstrate a broadly similar pattern across different age groups. As for men, the highest rates for women during the 1991-2008 period were in those aged 55-74. In 2008, the rate for this group peaked at 21.5 per 100,000. Rates in all other age groups decreased slightly and were lowest in women aged 15-34 at 1.3 per 100,000.<sup>15</sup>

## Alcohol related deaths by gender, 2001 to 2006<sup>16</sup>

### England

	2001	2002	2003	2004	2005	2006
<b>All persons</b>	<b>5,476</b>	<b>5,582</b>	<b>5,981</b>	<b>6,036</b>	<b>6,191</b>	<b>6,517</b>

## Alcohol Mortality by Region

There are wide geographical variations in alcohol-related death rates in England and Wales.

The Local Authorities with the highest alcohol-related death rates (2001-2003) were<sup>17</sup>

### Males

Local Authority	Rate per 100,000 population
Blackpool	43.9
Brighton and Hove	33.0
Camden	31.6
Manchester	31.0
Preston	29.5
Salford	29.3
Hammersmith and Fulham	29.0
Liverpool	28.6
Hounslow	27.4
Sandwell	26.6

### Females

Local Authority	Rate per 100,000 population
Corby	20.3
Blackpool	17.3
Barrow-in-Furness	16.5
Liverpool	16.4
North West Leicestershire	15.3
Denbighshire	14.9
Manchester	14.8
Sefton	14.1
Penwith	13.9
West Lancashire	13.7

## Alcohol-specific mortality rates by gender and region, England, 2001-2003<sup>18</sup>

Source: Alcohol-related deaths in England and Wales, 2001 to 2003. Office for National Statistics (2003)

## Alcohol-related deaths, by Government Office Region, England and Wales, (2001-2003)<sup>17</sup>

### Males

Government Office Region	Rate per 100,000 population
<b>England and Wales</b>	<b>14.7</b>
North East	16.8
North West	19.7
Yorkshire and The Humber	13.2
East Midlands	12.4
West Midlands	17.1
East of England	10.2
London	17.6
South East	12.9
South West	11.8
Wales	16.0

### Females

Government Office Region	Rate per 100,000 population
<b>England and Wales</b>	<b>7.4</b>
North East	9.6
North West	10.7
Yorkshire and The Humber	6.5
East Midlands	7.0
West Midlands	8.1
East of England	5.4
London	7.4
South East	6.2
South West	5.9
Wales	8.4

The regional differences in mortality reflect regional variations in alcohol consumption. (See *IAS Fact Sheet Excessive and Problem Drinking in Great Britain*)

## Alcohol-related deaths among residents of Government Office Regions, 2000-2004

Government Office Region [England]	2000 <sup>19</sup>	2001 <sup>19</sup>	2002 <sup>19</sup>	2003 <sup>19</sup>	2004 <sup>20</sup>	2005	% increase
North East	335	346	346	389	430	402	20.0
North West	950	1,053	1,065	1,115	1,179	1,173	23.5

1. Excludes mental illness hospitals, psychiatric units and maternity hospitals, and transfer cases have been excluded.
2. Diseases recorded using the World Health Organisation's International Classification of Diseases 10th Revision (ICD10).
3. Caution is necessary when interpreting these figures. The recording of alcohol misuse may vary from hospital to hospital.

Where alcohol misuse is suspected but unconfirmed it may not be recorded by the hospital.

4. Figures shown include an element of double counting where a patient is recorded as having more than one alcohol-related diagnosis.
5. Patients resident outwith Scotland or those where NHS board or council area of residence is not known, these figures are excluded from the Scotland total.
6. Age on admission.
7. Includes Scottish residents only.
8. Includes discharges where the poisoning diagnosis is undetermined or unspecified.

r Revised.

p Provisional.

## Health Benefits of Alcohol

There is evidence to suggest that light drinking may confer some health benefits on some people. The main health benefit is reduced risk of coronary heart disease (CHD). However, this protection, is restricted to middle-aged and older individuals in populations with a high risk of CHD, and even within these populations protection may be confined to certain subgroups.<sup>24</sup> It is not certain that reduced risk of death from CHD results in longer life expectancy.<sup>25</sup> At a population level, any protective effects of CHD may be cancelled out by increases in other causes of death.<sup>26</sup> There is no evidence to show that alcohol is necessary for health. Studies of lifetime abstainers show that they have a longer than average life expectancy.<sup>27</sup>

In the UK, the Strategy Unit estimated that alcohol prevents around 20,000 deaths a year by reducing the risk of CHD, about the same as its estimate of the number of premature deaths caused by alcohol.<sup>28</sup> However, the World Health Organisation estimates that globally alcohol is responsible for 1.8 million deaths per annum in net terms i.e with any lives saved by light drinking already being taken into account.<sup>1</sup>

Other possible benefits of alcohol consumption have been identified in relation to ischaemic stroke, peripheral vascular disease, diabetes, gallstones and cognitive functioning and dementia. However, the picture remains unclear, and the evidence is stronger for some conditions than others.<sup>24</sup> It is also suggested that alcohol may have some psychosocial benefits, such as lessening symptoms of stress. There are reports of low risk consumption of alcohol being associated with improved health status and improved mental wellbeing in older people. However, the evidence here is not conclusive. The evidence here is also inconclusive (see IAS Factsheets Alcohol and Mental Health and Alcohol and the Elderly)
